The shopfloor rear-view problem.

See production issues in time to do something about them.

Paper shift logs, delayed spreadsheets and disconnected updates can leave supervisors working from an incomplete picture. The challenge is not just collecting more data; it is making useful updates visible to the people who can act on them.

TURN RECORDED UPDATES INTO A CLEARER VIEW OF WORK IN PROGRESS

When the information arrives too late

01 **Shift updates are hard to see in time**

Production, quality and downtime information may be recorded in different places and reviewed after the work has moved on.

02 **Small stoppages are easy to miss**

Brief interruptions can disappear from handwritten logs, making recurring issues difficult to compare across shifts.

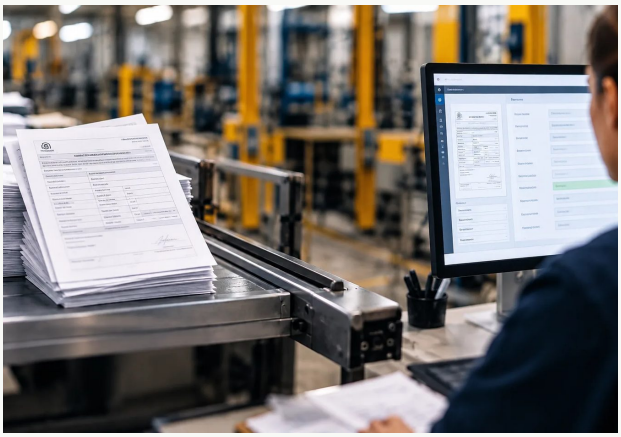

03 **Open issues lose their owner**

Without a shared view of status and next action, supervisors may need to ask around before they can respond.

Make the current picture easier to act on.

Start with the updates your team needs during a shift, then connect relevant information from the systems already in use.

TODAY

A report after the shift

Updates are written down, gathered and reconciled later. Useful context can be lost by the time the report is ready.

A repeatable workflow

Capture updates during the work > connect relevant job or production data > show status and exceptions > assign the next action > review with the team.

What a better process can support

CAPTURE

Record useful updates

Use simple digital forms or existing system feeds for progress, stoppages and issues.

CONNECT

Bring related context together

Link the update to the line, job, order or shift using the identifiers your operation already uses.

SEE

Make exceptions visible

Show status, ownership and items that need attention, with an update cadence that fits the process.

ACT

Support the next decision

Give supervisors enough context to follow up, adjust priorities or escalate a recurring issue.

What to measure

- Time from an event being recorded to someone seeing it
- Share of updates with a clear owner and next action
- Number of missing or late shift records
- Time needed to identify recurring stoppage patterns

The view is only as current as the information captured and connected. Integration options, update frequency and measures should be agreed around your operation.

Start with one process.
